11 – Installation Report

Client:	Agensi Nuclear Malaysia (Formally MINT) C/O: Kinematic		
Quotation Number:	13714	Date:	21/10/2019
Job Number:	IN1245	Date:	19/10/2020

Contact:	Edward Hong		
Date of Visit:	August 21st – August 25th 2023	No. of Days:	4 + 1 extra
Engineer:	James Hanson		

Details of visit:

Day 1 – Unit was pumping down when I arrived, software connectivity was not working so I could not get any data from the system from before the visit. Successfully installed both the prep board upgrade and electronics upgrade for the system. All boards removed, customer later packaged them all up into boxes along with the old cables. New Emag power supply installed in place of faulty old one, connected to Emag. Source was removed, the filament was broken so was replaced, and the source magnets were upside down so this was corrected. All lower barrel connectors to source pins were checked for tightness after one came off during handling. Customers shown how to change filament and the correct positioning of source magnets but advised not to change them themselves. Source fitted with new gasket and buzzed out fine, gas line from isolation valves connected and blue 4 way block connected. HDMI port on the PC was not working so I could not pump down the system or confirm connectivity on Monday. Arranged to get a Display Port to HDMI cable the next day. Customer changed the oil in all rotary pumps behind the systems and made new C and N tubes for the COM and RED furnaces plus H2O trap and CO2 trap.

Day 2 – Display Port to HDMI cable obtained in the morning. I finished off plugging everything in to the system controller and the mass spec. Communications with the mass spec and prep system established. Unit set to pump down late morning. No speed readbacks are visible but the turbo LEDs are on and audibly spool up to pull vacuum. No Source pressure readback, investigated swapping cables, diagnosed as faulty gauge flange section. Solved by assisting the gauge to fire, readbacks now functioning. Thermocouple error on the Reduction oven investigated, found to be a fault in the terminal block between the TC and the prep board link wires. Resolved with new 2 way terminal block, all oven TC's now working properly. Gases turned on, pressure readbacks functioning on He and O2. Flows checked to furnaces and sampler, with large drop in flow seen at the entrance to the trapping loop. Investigated for leaks, found to be the drop chamber front foot of the autosampler, flow then virtually unrestricted and suitable for running. Valve control not possible across some of the system, started to map out which valves were incorrectly configured and mimic errors using LED valve block. No mimic for system with trapping loop, so ref gas side programmed first. Valves configured to check system flow on standby flow and full carrier flow. Vacuum at 9.8e-8 by the end of the day, filament conditioned in 5-6 turns. Customer shown the source control switches on electronics box. Remote access advised to be difficult here, communication with IT started to allow access between working hours.

Day 3 – Vacuum down at 5.8e-7 on Source side, and 3.2e-8 on Analyser side. CO2 turned on and N2 turned on. N2 valve control cable has been cut and tied up in loom by a previous engineer. Ref gas flows measured and altered, He dilutor needle valve found to be faulty, flow of 280 uncontrollable at ref gas isolation valve pig tail. Dilutor flow crimped down to 15 ml/min. CO2 crimp opened to get ~11 ml/min on CO2 iso valve pig tail, as it was at 1 ml/min. Remote access assistance with Dave Harris at the end of the day to help configure the system and check functionality.

Day 4 – Nitrogen ref gas valve wiring fixed and programmed. Ref gas used to tune CO2 and N2 peak shape, good sensitivity at 20nAmps + CO2 and stability is good. Nitrogen stability is poor, some leaks found on needle valve He dilutor and resolved with no improvement. Nitrogen bottle is 'industrial nitrogen' unsure of the quality but has been used for years and not been an issue. Temperatures increased in all furnaces and GC, to 1000 COM, 600 RED and 60 GC as per their old settings. Remote access help with Dave Harris to install Geo software and provide a mimic for the system. Further assistance and checking of peak shape and event timing and analysis files etc to ensure correct function. Leak checked the system, found leaks on multiple valves, eventually resolved and unit held 24 PSI for 5 minutes from the He line to the trapping loop. O2 line was still at 25 PSI sealed off from V7 to V8, so leak check passed also. Ref gas precision run for CO2

11 – Installation Report

Client:	Agensi Nuclear Malaysia (Formally MINT) C/O: Kinematic		
Quotation Number:	13714	Date:	21/10/2019
Job Number:	IN1245	Date:	19/10/2020

passed with current tuning at 0.09 SD. Nitrogen precision quite poor, retuned but still not great. Dual samples made at 5ul 400-100, successfully seen 2 peaks and integration window adjusted accordingly. Retune of both N2 and CO2 peak shapes by Dave remotely. System set to run Prec and Lin for both CO2 and N2 overnight. Returning tomorrow for final precision run on dual samples and training on new software.

Day 5 – Customers trained on;

- Stability ref gas for C and N
- Source HT tuning using peak shape 2:1 for C and N.
- Sample list preparation including blanks and references and samples with weights.
- Reprocessor functionality to view and interpret data.
- Analysis window editing
- Furnace drive and ccol down increments of 200 advised with 10 minute pause between drives.

System passed leak check. Ref gas run reprocessed today. CO2 precision at 0.1 SD. Nitrogen precision is at 0.2. CO2 ref gas linearity is at 0.5 uncorrected. Nitrogen ref gas linearity is at 0.9. Dual samples run and peaks detected. Dual analysis precision gave 0.19 SD for both CO2 and Nitrogen across 5 samples with beam heights of 2.9e-8 for N and 9.2e-8 for C. Data in file 'DUAL_TEST JAMES'. Sample sensitivity of N was low at 1.4e-9. Sensitivity of C was low at 2.6e-9. Source crimp on sample iso valve opened from 3.1e-6 to 5.0e-6. Sample sensitivity increased by ~50%. Trap for CO2 increased to 250 and trap for N increased to 650. CO2 sample sensitivity upped to 5.9e-9. N sensitivity not tested with a new sample. C peak shape is good, ref gas sensitivity is 12nA. C stability is good, 2:1 of 0.011. N peak shape is acceptable, ref gas sensitivity is 34nA. N stability has been poor, using lower grade N cylinder currently, new cylinder ready to be swapped out by customer after visit. Furnaces set to lower as the customers are away the next week. Further samples run at the end of the day to confirm higher sensitivity. System functioning.

Recommendations:

Use higher grade Nitrogen. Purified Nitrogen bottle brought into lab on 25/8 but not connected.
Consider Gilson upgrade to verSA system with heated block + prep system.
Consider purchasing a new autosampler or send back current sampler to us for maintenance if possible – current sampler is very dirty and could be contaminated (cleaned by JH on site with air canister and small brush).

Faults and Shortages:

Pump speed readback not working – conn cables not found in drawer.
Source HP readbacks not working – nonsense value but source is responsive to HP changes.
Gilson connectivity failure.
Inlet pump control wired to valve, fault found but not rectified. Customer informed and shown.

Follow up:

Troubleshoot basic Gilson connectivity.
Speak with customer about further upgrades in the future.

Ref: PO No : KR2392/10/2020/ED - Agensi Nuclear Malaysia (MINT) - System upgrade

To whom it may concern,

Concerning PO No : KR2392/10/2020/ED from Agensi Nuclear Malaysia (MINT) for the System upgrade, unfortunately due to COVID19 we are not able to send an engineer to perform the upgrade at this time.

As soon as the restrictions change and the engineers are able to travel to Malaysia this job will be completed ASAP.
